Empathy map canvas

Use this framework to empathize with a customer, user, or any person who is affected by a team's work. Document and discuss your observations and note your assumptions to gain more empathy for the people you serve.

Develop shared understanding and empathy

Summarize the data you have gathered related to the people that are impacted by your work. It will help you generate ideas, prioritize features, or discuss decisions.

WHO are we empathizing with?

Who is the person we want to understand?
What is the situation they are in?
What is their role in the situation?

GOAL

What do they need to DO?

What do they need to do differently?
What job(s) do they want or need to get done?
What decision(s) do they need to make?
How will we know they were successful?

What do they HEAR?

What are they hearing others say?
What are they hearing from friends?
What are they hearing from colleagues?
What are they hearing second-hand?

What do they THINK and FEEL?

PAINS

What are their fears, frustrations, and anxieties?

GAINS

What are their wants, needs, hopes, and dreams?

What do they SEE?

What do they see in the marketplace?
What do they see in their immediate environment?
What do they see others saying and doing?
What are they watching and reading?

What do they SAY?

What have we heard them say?
What can we magine them saying?

What other thoughts and feelings might influence their behavior?

What do they DO?

What do they do today?
What behavior have we observed?
What can we imagine them doing?

The universities chances of admission project is a well-researched topic in the field or education and machine learning

The ability to accurately predict the chances of admission to universities may help students make more informed decisions about their academic pursuits and, by increasing their chances of being admitted at a university, contribute to higher education.

A projects aims to predict the chances of a student getting admitted to a particular university, based on certain factors the business value of this project.

Canadian universities are considered by some in the higher education sector to be inefficient organizations, largely because they are slow to make decisions related to cost effectiveness.

Universities admission is the process by which students are selected to attend a college or university. The process typically involves some form of evaluation, submitting an application, and sometimes participating in interviews or other evaluations.

In terms of their autonomy canadian universities enjoy a high degree of control in decision-making from universities in many other countries. Australian public universities, although they are quite different. Archive High. Australian public universities autonomy as canadian universities.

There is a threat to introduce other control mechanisms into decision-making autonomy of the universities. In fact, universities are very complex organizations and comparable with other complex systems.

students are often worried about their changes of admission to a specific university admission process for a particular program. By being well-informed about their chances students can increase their changes of being admitted to the university of their choice.

the business for a machine learning model to predict chances of a student getting admitted to a project aims to predict the chances of a students getting admitted to a particular university based on certain factors.

university admission is the process by which students are selected to attend a college or university. the process typically involves some form of evaluation, submitting an application,

the aim of this project to help students in short listing universities with their profiles

The complexity of organizations can be measured in many ways, by their number of employee or clients, the geographic spread, budgets, diversity or functions, or factors and others.

As for closing down programs, it appears that universities find there are very few programs that can be closed down without a serious quality or without producing a public outcry.

The predicted output gives them a fair idea about their admission chances in a particular university.

With this project, students can make more informed decisions about which universities can make more efficient use of their resource by focusing on the many promising applicants.

This is not a single technique but, rather a wide array of decision-making techniques, ranging from conventional analytics all the way through to artificial intelligence.

The maintenance of stability requires governments to operate with balanced budgets, to maintain those programs that governments in the public demand even though very costly.

The success of any machine learning and decision-making. But reaching reliable conclusions altogether their exist, in addition to having to process amounts of data.

They do raise prices moderate by increasing tuition fees, although some are not permitted to charge more than a charging lab fees , by selling class notes and so forth.

The aim of this project is to help students in short listing universities with their profiles. Machine learning algorithms are trained from a model on this data. Which can be used to predict chances for future applications being admitted.

The project, students can make more informed decisions about which universities to apply to., by focusing on the many more efficient use of the resource by focusing of the most promising applications.

exating on one the important factors that may affect the interest, because of that can leads to misleard in the results.

models such as ANN (sigma function) and SVM (radial basis they follow distance- based method) are considered relevant in domain

visual analysis is the process of using visual representations such as charts,plots,and graphs,on locations and understand trends, outliers, and other identify patterns,trends,and relationships in data.which help to gain insights and make informed decisions

The sealborn package provides various functions sharpen.With the help of ddcplot. We can create a variety of plots and features. To make multiple graphs in a single plot,We use subplot.
